The authors write, "The primary aim of this book is to show how simple mathematical models of the transmission of infectious agents within human communities can help to interpret observed epidemiological trends, to guide the collection of data towards further understanding, and to design programmes for the control of infection and disease.

Smallpox was the first disease, and so far the only infectious disease of humans, to be eradicated
by deliberate intervention. It became the first disease for which there was an effective vaccine in
1798 when Edward Jenner showed the protective effect of inoculation (vaccination) of humans with
material from cowpox lesions.. Smallpox (variola) occurred in two clinical varieties: variola major ...
