Relative Dating Lab Gore Geology

This laboratory manual is designed for introductory geology students with no prior geology coursework. The chapter on Relative Dating gives the student experience with using basic geologic principles for determining the sequence of geologic events, a topic that is typically presented in the first few chapters of historical geology lecture textbooks.

Relative Dating Geologic Events GLS 100 Physical Geology – Dr. Hanson In this lab you will learn how geologists use rocks and apply the laws of relative age dating to determine sequences of geologic events. Once you are comfortable with the concepts presented here we will go to Forest River Park and try to interpret some local bedrock exposures.

This lab manual is accessible to science and nonscience majors and also provides a strong background for geology and other science majors. Concepts carry over from one lab to the next and are reinforced so that at the end of the semester, the students have experience at interpreting the rock record and an understanding of how the process of science works.

8.2 Relative Dating Methods. The simplest and most intuitive way of dating geological features is to look at the relationships between them. There are a few simple rules for doing this, some of which we've already looked at in Chapter 6. For example, the principle of superposition states that sedimentary layers are deposited in sequence, and, unless the entire sequence has been turned over by tectonic processes or disrupted by faulting, the layers at the bottom are older than those at the top.

8.2 Relative Dating Methods - Physical Geology

Relative age dating simply describes the age of something relative to other things. So a rock layer that has layers above and below it is older than the layers above it and younger than the layers below it. Absolute age dating describes the age of something in exact units, like years. It is more specific than relative age dating.

Relative dating principle. In any sequence of undeformed sedimentary rocks (or laval flows), the oldest rock is always at the bottom, and the youngest is at the top. Therefore, each layer of rock represents an interval of time that is more recent than that of the underlying rocks.
