Messenger RNA, transfer RNA, and ribosomal RNA work together in prokaryotic and eukaryotic cells to translate DNA's genetic code into functional proteins. These proteins, in turn, direct the expression of genes.

13.1 RNA

The main differences between RNA and DNA are that (1) the sugar in RNA is ribose instead of deoxyribose; (2) RNA is generally single-

Read PDF Rna And Protein Synthesis Chapter 13

stranded, not double-stranded; and (3) RNA contains uracil in place of thymine.

Assessment Chapter Test B

The chain of command is from DNA in the nucleus of the cell to RNA to protein synthesis in the cytoplasm The two main stages are:

- Transcription, the transfer of genetic information of the gene is transcribed into RNA
- Translation, the transfer of information in the RNA molecule

into a protein

DNA & Protein Synthesis

- RNA is the genetic material of some viruses and is necessary in all organisms for protein synthesis to occur. RNA could have been the “original” nucleic acid when life first arose on Earth some 3.8 billion years ago.
- Like DNA, all RNA molecules have a similar chemical
