that the theory of constraints and throughput accounting (TOC/TA) is not the only approach used in decision making. Other methods are:

- standard cost accounting
- activity based costing
- marginal costing.

The general hypothesis of TOC/TA is that constraints are impediments to achieving a firm's goal and their impact reduces profits.

Theory of Constraints and Throughput Accounting

Throughput Accounting is a modern management accounting technique that offers an alternative view to the more traditional cost accounting. It's all about identifying the constraint or limiting factor in the production process and exploiting it to maximise profit. Throughput accounting ratio (TPAR) = Return per factory hour/cost per factory hour. In any organisation, you would expect the throughput accounting ratio to be greater than 1. This means that the rate at which the organisation is generating cash from sales of this product is greater than the rate at which it is incurring costs.
